

## 1-9: Notation for Recursive Formulas

## Warm-up:

1.
  - a. What number comes after 5? Before 5? How did you determine your answers?
  - b. What number comes after  $n$ ? Before  $n$ ? How did you determine your answers?
2. Matt Mitarnowski has to repay a \$300 loan, and he makes \$30 payments each month for  $n$  months.
  - a. Write a recursive formula for the sequence.
  - b. Find the first 5 terms.

*Question:* Since using the “previous term” is not a very mathematical thing to do, what can we do instead?

*Example 1:* Rewrite the following recursive formula mathematically correct, then find the first four terms.

$$\begin{cases} t_1 = 50 \\ t_n = 1.05(\text{previous}), \text{ for int. } n \geq 2 \end{cases}$$

*Example 2:* Find the first 5 terms of the sequence.

$$\begin{cases} h_1 = 14 \\ h_n = 2h_{n-1} + 3, \text{ for int. } n \geq 2 \end{cases}$$

*Example 3:* Find the first 4 terms of the sequence.

$$\begin{cases} w_1 = 4 \\ w_n = 3w_{n-1} - n, \text{ for int. } n \geq 2 \end{cases}$$

*Example 4:* Find the first 6 terms of the sequence.

$$\begin{cases} g_1 = 4 \\ g_2 = 6 \\ g_n = 2g_{n-2} + g_{n-1}, \text{ for all int. } n \geq 2 \end{cases}$$

*Homework:*

“In terms of being late or not starting at all, then it's never too late.” - Alison Headley
